  Abstract—This manual provides an introduction to

Abstract—This manual provides an introduction to SVM.

#### 1 Reflection

1.1 Find the distance of  $\mathbf{x}_1 = \begin{pmatrix} 2 \\ 1 \end{pmatrix}$  from the line

$$\begin{pmatrix} 3 & 4 \end{pmatrix} \mathbf{x} + 5 = 0 \tag{1.1}$$

1.2 Show that the distance of the point  $\mathbf{x}_1$  from the line

$$\mathbf{n}^T \mathbf{x} + c = 0, \quad ||\mathbf{n}|| = 1 \tag{1.2}$$

is

$$M = \left| \mathbf{n}^T \mathbf{x}_1 + c \right| \tag{1.3}$$

- 1.3 Find the reflection  $x_2$  of  $x_1$ .
- 1.4 Define

$$f(\mathbf{x}) = \mathbf{n}^T \mathbf{x} + c \tag{1.4}$$

1.5 Compute  $f(\mathbf{x_1})$  and  $f(\mathbf{x_2})$ . Comment.

## 2 Optimization Problem

2.1 Suppose  $(\mathbf{x_1}, y_1)$  and  $(\mathbf{x_2}, y_2)$  are i/o data for a system where  $y_1, y_2 \in \{1, -1\}$ . If you want to find  $\mathbf{n}, c$  from the given dataset, how will formulate the equivalent optimization problem? **Solution:** Consider the optimization problem

$$\max_{\mathbf{n} \in \mathcal{L}} M \tag{2.1}$$

s.t 
$$y_1\left(\mathbf{x}_1^T\mathbf{n} + c\right) \ge M$$
 (2.2)

$$y_2\left(\mathbf{x}_2^T\mathbf{n}+c\right) \ge M \tag{2.3}$$

$$||\mathbf{n}|| = 1 \tag{2.4}$$

2.2 The *signum* function is defined as

$$\operatorname{sgn}(z) = \begin{cases} 1 & z > 0 \\ 0 & z = 0 \\ -1 & z < 0 \end{cases}$$
 (2.5)

Show that

$$\operatorname{sgn}(\mathbf{x}^T\mathbf{n} + c) = \operatorname{sgn}(\mathbf{x}^T\mathbf{w} + d) \tag{2.6}$$

where

$$\mathbf{w} = \frac{\mathbf{n}}{M}, d = \frac{c}{M}, M > 0 \tag{2.7}$$

2.3 Show that (2.1)-(2.4) can be reformulated as

$$\min_{\mathbf{w},d} \frac{1}{2} ||\mathbf{w}||^2 \tag{2.8}$$

s.t 
$$y_i \left( \mathbf{x}_i^T \mathbf{w} + d \right) \ge 1$$
 (2.9)

**Solution:** From (2.7),

$$\mathbf{w} = \frac{\mathbf{n}}{M} \implies ||\mathbf{w}|| = \frac{||\mathbf{n}||}{M}$$
 (2.10)

$$\implies M = \frac{1}{\|\mathbf{w}\|} : \|n\| = 1 \tag{2.11}$$

Thus,

$$\max_{\mathbf{n},c} M = \max_{\mathbf{w},d} \frac{1}{\|\mathbf{w}\|} = \min_{\mathbf{w},d} \|\mathbf{w}\|. \tag{2.12}$$

<sup>\*</sup> The authors are with the Department of Electrical Engineering, Indian Institute of Technology, Hyderabad 502285 India e-mail: gadepall@iith.ac.in.

Also, (2.2)-(2.3) become

$$y_i \left( \mathbf{x}_i^T \mathbf{w} + d \right) \ge 1 \tag{2.13}$$

3 Solver

3.1 Solve (2.8) using cvxpy/cvxopt for  $\mathbf{x}_1 = \begin{pmatrix} 2 \\ 1 \end{pmatrix}, y_1 = 1$  and  $\mathbf{x}_2 = \begin{pmatrix} 0.8 \\ -0.6 \end{pmatrix}, y_2 = -1$ .

**Solution:** From the given information, the constraints in (2.8) become

$$\begin{pmatrix} 2 & 1 \end{pmatrix} \mathbf{w} + d \ge 1 \tag{3.1}$$

$$(0.8 -0.6)$$
**w** +  $d \le -1$  (3.2)

The following code results in

$$\mathbf{w}_{opt} = (0.6 \ 0.8), d_{opt} = 1, ||\mathbf{w}_{opt}||^2 = 1 \ (3.3)$$

from cvxpy import \* import numpy as np

# x is array of datapoints stacked column wise [x1, x2, ..., xn]

# y is matrix with labels stacked diagonally y = np.diag([1,-1])

n=2 #no of datapoints

p=2 #no of parameters of each datapoint

d= Variable()

d v = np.ones((p,1))\*d

#broadcasted d into a vector d v

w = Variable((p,1),nonneg=False)

#objective function

obj = Minimize(0.5\*square(norm(w)))

#constraints

constraints =  $[((x@y).T)@w + y@d_v>= np$ .ones((n,1))]

Problem(obj, constraints).solve()

print("Minimum value of Cost function= ",
 obj.value)

print("Minima is at w = n", w.value)

print("Minima is at d= ",d.value)

3.2 Provide a graphical representation for (2.8)

**Solution:** The following code plots Fig. 3.2. The constraint lines in (3.1)-(3.2) are plotted for d = 0, 0.5 and 1. The circles  $||\mathbf{w}||^2 = r^2$  are plotted for r = 1, 2 and 3. The smalles circle that satisfies the constraints is obtained when d = 1

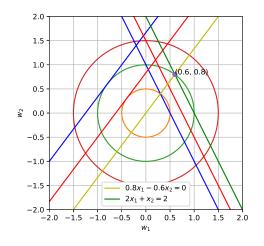

Fig. 3.2

#### 4 KKT Solution

4.1 Show that the Lagrangian for (2.8) can be expressed as

$$L_{p}(\mathbf{w}, \boldsymbol{\alpha}, d) = \frac{1}{2} \|\mathbf{w}\|^{2}$$
$$-\boldsymbol{\alpha}^{T} \left( \begin{pmatrix} y_{1}\mathbf{x}_{1} & y_{2}\mathbf{x}_{2} \end{pmatrix}^{T} \mathbf{w} + d \begin{pmatrix} y_{1} \\ y_{2} \end{pmatrix} - \begin{pmatrix} 1 \\ 1 \end{pmatrix} \right)$$
(4.1)

where

$$\alpha = \begin{pmatrix} \alpha_1 \\ \alpha_2 \end{pmatrix} \tag{4.2}$$

are the Lagrange multipliers.

Solution: The Lagrangian is given by,

$$L_{p}(\mathbf{w}, \boldsymbol{\alpha}, d) = \frac{1}{2} \|\mathbf{w}\|^{2}$$
$$- \sum_{i=1}^{2} \alpha_{i} \left\{ y_{i} \left( \mathbf{x}_{i}^{T} \mathbf{w} + d \right) - 1 \right\}$$
(4.3)

which can be simplified to obtain (4.1)

4.2 Show that the stationarity condtion with respect to **w** yields

$$(\mathbf{I} - (y_1 \mathbf{x}_1 \quad y_2 \mathbf{x}_2) \quad \mathbf{0}) \begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = 0$$
 (4.4)

**Solution:** From the stationarity condition

$$\nabla_{\mathbf{w}} L_p\left(\mathbf{w}, \boldsymbol{\alpha}, d\right) = 0 \tag{4.5}$$

or, 
$$\mathbf{w} - (y_1 \mathbf{x}_1 \quad y_2 \mathbf{x}_2) \boldsymbol{\alpha} = 0$$
 (4.6)

resulting in (4.4).

4.3 Show that the stationarity condition with respect to  $\alpha$  yields

$$\left( \begin{pmatrix} y_1 \mathbf{x}_1 & y_2 \mathbf{x}_2 \end{pmatrix}^T \quad \mathbf{0} \quad \begin{pmatrix} y_1 \\ y_2 \end{pmatrix} \right) \begin{pmatrix} \mathbf{w} \\ \boldsymbol{\alpha} \\ d \end{pmatrix} = \begin{pmatrix} 1 \\ 1 \end{pmatrix} \quad (4.7)$$

**Solution:** 

$$\nabla_{\alpha} L_p(\mathbf{w}, \alpha, d) = 0 \quad (4.8)$$

$$\implies (y_1 \mathbf{x}_1 \quad y_2 \mathbf{x}_2)^T \mathbf{w} + d \begin{pmatrix} y_1 \\ y_2 \end{pmatrix} - \begin{pmatrix} 1 \\ 1 \end{pmatrix} = 0 \quad (4.9)$$

after simplification resulting in (4.7)

4.4 Find the stationarity condition with respect to *d*.

**Solution:** 

$$\nabla_d L_n(\mathbf{w}, \boldsymbol{\alpha}, d) = 0 \tag{4.10}$$

$$\implies (y_1 \ y_2)\alpha = 0 \qquad (4.11)$$

or, 
$$(\mathbf{0} \quad (y_1 \quad y_2) \quad 0) \begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = 0$$
 (4.12)

4.5 Obtain a matrix equation for **w** and *d*. **Solution:** (4.4) (4.7) and (4.12) can be stacked into a single matrix equation as

$$\begin{pmatrix}
\mathbf{I} & -(y_1\mathbf{x}_1 & y_2\mathbf{x}_2) & \mathbf{0} \\
(y_1\mathbf{x}_1 & y_2\mathbf{x}_2)^T & \mathbf{0} & \begin{pmatrix} y_1 \\ y_2 \end{pmatrix} \begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \mathbf{w} \\ \alpha \\ d \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \mathbf{w} \\ \alpha \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\begin{pmatrix} \mathbf{w} \\ \alpha \\ 0 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

4.6 Find the optimal values of **w** and *d* by solving (4.13) using python.

# **Solution:**

wget https://github.com/gadepall/EE1390/raw/master/manuals/svm/codes/svm\_matrix.py

#### 5 Duality

5.1 Substitute (4.4) and (4.12) in the primal function to obtain the Lagrangian (Wolfe) dual objective function  $L_D$ .

**Solution:** From (4.4)

$$\mathbf{w} = \begin{pmatrix} y_1 \mathbf{x}_1 & y_2 \mathbf{x}_2 \end{pmatrix} \boldsymbol{\alpha} \tag{5.1}$$

$$\implies \mathbf{w}^T \mathbf{w} = \boldsymbol{\alpha}^T \begin{pmatrix} y_1 \mathbf{x}_1^T \\ y_2 \mathbf{x}_2^T \end{pmatrix} (y_1 \mathbf{x}_1 \quad y_2 \mathbf{x}_2) \boldsymbol{\alpha} \quad (5.2)$$

and 
$$\boldsymbol{\alpha}^T (y_1 \mathbf{x}_1 \ y_2 \mathbf{x}_2)^T \mathbf{w} = \mathbf{w}^T \mathbf{w}$$
 (5.3)

From (4.12),

$$(y_1 \quad y_2)\alpha = 0 \tag{5.4}$$

$$\implies \alpha^T d \begin{pmatrix} y_1 \\ y_2 \end{pmatrix} = 0 \tag{5.5}$$

Substituting from the above in (4.1),

$$L_D(\boldsymbol{\alpha}) = -\frac{1}{2} \boldsymbol{\alpha}^T \begin{pmatrix} y_1 \mathbf{x}_1^T \\ y_2 \mathbf{x}_2^T \end{pmatrix} \begin{pmatrix} y_1 \mathbf{x}_1 & y_2 \mathbf{x}_2 \end{pmatrix} \boldsymbol{\alpha} + \boldsymbol{\alpha}^T \begin{pmatrix} 1 \\ 1 \end{pmatrix} \quad (5.6)$$

5.2 From (4.1), show that

$$L_p(\mathbf{w}, \boldsymbol{\alpha}, d) \le \frac{1}{2} \|\mathbf{w}\|^2 \tag{5.7}$$

5.3 Let  $f^*$  be the solution of (2.8). Show that

$$\min_{\mathbf{w},d} L_p(\mathbf{w}, \boldsymbol{\alpha}, d) \le f^* \tag{5.8}$$

5.4 Show that

$$L_D(\alpha) = \min_{\mathbf{w}, d} L_p(\mathbf{w}, \alpha, d)$$
 (5.9)

5.5 Show that

$$f^* = \max_{\alpha} L_D(\alpha) \tag{5.10}$$

s.t. 
$$\alpha \ge 0$$
 (5.11)

$$\nabla_d L_p\left(\mathbf{w}, \boldsymbol{\alpha}, d\right) = 0 \tag{5.12}$$

## **Solution:**

wget https://github.com/gadepall/EE1390/raw/master/manuals/svm/codes/wolfe dual.py

5.6 Verify the above result by theoretically solving (5.10).

#### 6 Inseparable Data

6.1 Given  $(\mathbf{x}_i, y_i)$ ,  $i = 1 \dots n$  are i/o data for a system. If you want to find  $\mathbf{w}$ , d from the given

dataset, how will you formulate the equivalent optimization problem by modifying (2.8)?

**Solution:** The desired expression is

$$\min_{\mathbf{w},d} \frac{1}{2} \|\mathbf{w}\|^2 \tag{6.1}$$

s.t 
$$y_i \left( \mathbf{x}_i^T \mathbf{w} + d \right) \ge 1 - \xi_i$$
 (6.2)

$$\xi_i \ge 0 \tag{6.3}$$

s.t 
$$y_i \left( \mathbf{x}_i^T \mathbf{w} + d \right) \ge 1 - \xi_i$$
 (6.2)  
 $\xi_i \ge 0$  (6.3)  

$$\sum_{i=1}^{n} \xi_i \le C$$
 (6.4)

Note that C is also a parameter that needs to be given for estimating the parameters  $\mathbf{w}, d$  of the SVM engine.

6.2 How will you classify the output y for a given input x.

**Solution:** 

$$y = \operatorname{sgn}\left(\mathbf{x}^T\mathbf{w} + d\right) \tag{6.5}$$

6.3 Explain (6.1) through an example.

**Solution:** The following code plots Fig. (6.3)

wget https://github.com/gadepall/EE1390/raw/ master/manuals/svm/codes/svm err.py

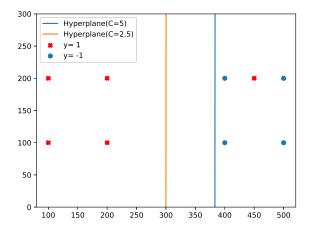

Fig. 6.3

As can be seen, the position of the line separating the two sets is heavily dependent on C.

6.4 Modify (6.1) so that C doesn't appear as a constraint.

**Solution:** The desired expression is

$$\min_{\mathbf{w},d} \frac{1}{2} \|\mathbf{w}\|^2 + C \sum_{i}^{n} \xi_i$$
 (6.6)

s.t 
$$y_i \left( \mathbf{x}_i^T \mathbf{w} + d \right) \ge 1 - \xi_i$$
 (6.7)  
 $\xi_i \ge 0$  (6.8)

$$\xi_i \ge 0 \tag{6.8}$$

6.5 Explain (6.6) through an example.

**Solution:** The following code plots Fig. (6.5). It is obvious that the misclassification distance decreases as the penalty increases.

wget https://github.com/gadepall/EE1390/raw/ master/manuals/svm/codes/svm regular. py

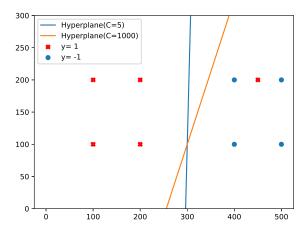

Fig. 6.5
