Abstract—This manual provides an introduction to linear lethods in regression.

1 THE GAUSSIAN DISTRIBUTION

1.1 Generate a Gaussian random number with 0 mean and unit variance.

Solution: Open a text editor and type the following program.

#!/usr/bin/env python

#This program generates a Gaussian random no with 0 mean and unit variance

#Importing numpy import numpy as np

print (np.random.normal(0,1))

Save the file as gaussian_no.py and run the program.

*The author is with the Department of Electrical Engineering, Indian Institute of Technology, Hyderabad 502285 India e-mail: gadepall@iith.ac.in. All content in this manual is released under GNU GPL. Free and open source.

1.2 The mean of a random variable X is defined as

$$E[X] = \frac{1}{N} \sum_{i=1}^{N} X_i$$
 (1.1)

and its variance as

$$var[X] = E[X - E[X]]^2$$
 (1.2)

Verify that the program in 1.1 actually generates a Gaussian random variable with 0 mean and unit variance.

Solution: Use the header in the previous program, type the following code and execute.

#This program generates a Gaussian random no with 0 mean and unit variance

#Importing numpy import numpy as np

simlen = int(1e5) #No of samples

n = np.random.normal(0,1,simlen)#Random vector

mean = np.sum(n)/simlen #Mean value

print (mean)

print (var)

1.3 Using the previous program, verify you results for different values of the mean and variance.

2 CDF AND PDF

2.1 A Gaussian random variable X with mean 0 and unit variance can be expressed as $X \sim$

 $\mathcal{N}(0,1)$. Its cumulative distribution function (CDF) is defined as

$$F_X(x) = \Pr(X < x), \qquad (2.1)$$

Plot $F_X(x)$.

Solution: The following code yields Fig. 2.1.

#Importing numpy, scipy, mpmath and pyplot import numpy as np import matplotlib.pyplot as plt

x = np.linspace(-4,4,30)#points on the x axis simlen = int(1e5) #number of samples err = [] #declaring probability list n = np.random.normal(0,1,simlen)

for i in range(0,30):

err_ind = np.nonzero(n < x[i]) #
 checking probability condition
err_n = np.size(err_ind) #
 computing the probability
err.append(err_n/simlen) #storing
 the probability values in a list</pre>

plt.plot(x.T,err)#plotting the CDF plt.grid() #creating the grid plt.xlabel('\$x\$') plt.ylabel('\$F_X(x)\$') plt.show() #opening the plot window

2.2 List the properties of $F_X(x)$ based on Fig. 2.1. 2.3 Let

$$p_X(x_i) = \frac{F_X(x_i) - F_X(x_{i-1})}{h}, i = 1, 2, \dots h$$
(2.2)

for $x_i = x_{i-1} + h$, $x_1 = -4$. Plot $p_X(x_i)$. On the same graph, plot

$$p_X(x) = \frac{1}{\sqrt{2\pi}} e^{-x^2/2}, -4 < x < 4$$
 (2.3)

Solution: The following code yields the graph in Fig. 2.3

https://github.com/gadepall/EE1390/raw/master/manuals/supervised/linear_class/codes/1.4.py

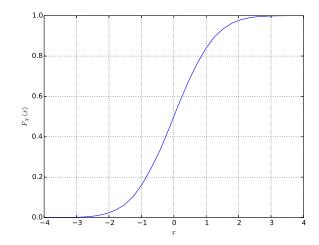

Fig. 2.1: CDF of *X*

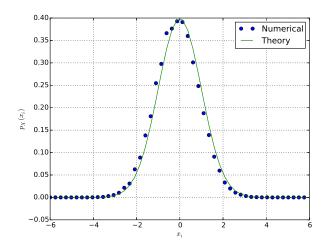

Fig. 2.3: The PDF of X

Thus, the PDF is the derivative of the CDF. For $X \sim \mathcal{N}(0, 1)$, the PDF is

$$p_X(x) = \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}}, \quad -\infty < x < \infty$$
 (2.4)

2.4 For $X \sim \mathcal{N}(\mu, \sigma^2)$,

$$p_X(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-\mu)^2}{2\sigma^2}}, \quad -\infty < x < \infty$$
 (2.5)

Plot $p_X(x)$ for different values of μ and σ in the same graph. Comment.

3 Detection & Estimation

3.1 Use the following code

https://raw.githubusercontent.com/gadepall/ EE1390/master/manuals/supervised/ linear_class/codes/2.3.py

to generate a scatterplot of X.

3.2 Suppose you wanted to classify *X* into two groups. How would you do so by looking at the scatterplot?

4 Bayes Classifier

4.1 Let

$$x = A(2s - 1) + n \tag{4.1}$$

where $s \in \{0, 1\}, n \sim \mathcal{N}(0, 1)$.

4.2 Show that

$$x|0 \sim \mathcal{N}(-A, 1) \tag{4.2}$$

$$x|1 \sim \mathcal{N}(A,1) \tag{4.3}$$

Solution: From the given information, for s = 0,

$$x|0 = -A + n \tag{4.4}$$

$$\implies E[x|0] = -A \tag{4.5}$$

and
$$E[(x+A)^2|0] = E[n^2] = 1$$
 (4.6)

Similar approach can be used for x|1.

4.3 Find

$$p_{X|0}(x)$$
 and $p_{X|1}(x)$ (4.7)

Solution:

$$p_X(x|0) = \frac{1}{\sqrt{2\pi}} e^{-\frac{(x+A)^2}{2}}, \quad -\infty < x < \infty \quad (4.8)$$

$$p_X(x|1) = \frac{1}{\sqrt{2\pi}} e^{-\frac{(x-A)^2}{2}}, \quad -\infty < x < \infty \quad (4.9)$$

- 4.4 Show that e^{-x} is monotonically decreasing.
- **4.5** Find

$$p_X(x|1) \stackrel{1}{\underset{0}{\gtrless}} p_X(x|0)$$
 (4.10)

Solution: The given condition can be expressed as

$$\frac{1}{\sqrt{2\pi}}e^{-\frac{(x-A)^2}{2}} \underset{0}{\stackrel{!}{\gtrless}} \frac{1}{\sqrt{2\pi}}e^{-\frac{(x+A)^2}{2}} \tag{4.11}$$

$$\implies -\frac{(x-A)^2}{2} \stackrel{1}{\gtrless} -\frac{(x+A)^2}{2} \tag{4.12}$$

$$\implies x \underset{0}{\stackrel{1}{\gtrless}} 0 \tag{4.13}$$

after simplification.

4.6 Show that

$$p_X(0|x) \stackrel{0}{\gtrless} p_X(1|x)$$
 (4.14)

$$\implies p_X(x|0) \stackrel{0}{\gtrless} p_X(x|1) \tag{4.15}$$

if

$$p(0) = p(1) \tag{4.16}$$

Solution: Since

$$p_X(1|x) \stackrel{1}{\underset{0}{\gtrless}} p_X(0|x)$$
 (4.17)

$$\implies \frac{p_X(x|1)p(1)}{p(x)} \stackrel{1}{\underset{0}{\gtrless}} \frac{p_X(x|0)p(0)}{p(x)}, \quad (4.18)$$

the result follows.

5 Probability of Error

5.1 Find the probability of error given that s = 0. **Solution:** The desired probability is given by

$$P_{e|0} = \Pr(x|0 > 0) = \Pr(-A + n > 0)$$
 (5.1)

$$= \Pr\left(n > A\right) \tag{5.2}$$

5.2 The Q-function is defined as

$$Q(A) = \Pr(n > A), \quad A > 0$$
 (5.3)

Plot Q(A) from 0 to 10 dB.

Solution:

https://raw.githubusercontent.com/gadepall/ EE1390/master/manuals/supervised/ linear class/codes/bpsk ber.py

6 Linear Discriminant Analysis

6.1 The multivariate Gaussian distribution is defined as

$$= \frac{1}{\sqrt{(2\pi)^k |\Sigma|}} \exp\left\{-\frac{1}{2} (\mathbf{x} - \boldsymbol{\mu})^T \boldsymbol{\Sigma}^{-1} (\mathbf{x} - \boldsymbol{\mu})\right\}$$
(6.1)

where μ is the mean vector, $\Sigma = E\left[(\mathbf{x} - \mu) (\mathbf{x} - \mu)^T \right]$ is the covariance matrix and $|\Sigma|$ is the determinant of Σ .

6.2 For

$$\mathbf{x} = \begin{pmatrix} x_1 \\ x_2 \end{pmatrix}, \tag{6.2}$$

show that

$$p_{\mathbf{x}}(\mathbf{x}) = \frac{1}{2\pi\sigma_{1}\sigma_{2}\sqrt{1-\rho^{2}}} \exp\left[-\frac{1}{2(1-\rho^{2})}\right] \times \left\{ \frac{(x_{1}-\mu_{1})^{2}}{\sigma_{1}^{2}} + \frac{(x_{2}-\mu_{2})^{2}}{\sigma_{2}^{2}} - \frac{2\rho(x_{1}-\mu_{1})(x_{2}-\mu_{2})}{\sigma_{1}\sigma_{2}}\right\}$$
(6.3)

where

$$\boldsymbol{\mu} = \begin{pmatrix} \mu_1 \\ \mu_2 \end{pmatrix}, \boldsymbol{\Sigma} = \begin{pmatrix} \sigma_1^2 & \rho \sigma_1 \sigma_2 \\ \rho \sigma_1 \sigma_2 & \sigma_2^2 \end{pmatrix} \tag{6.4}$$

6.3 Let

$$\mathbf{s}_0 = \begin{pmatrix} a \\ 0 \end{pmatrix} \tag{6.5}$$

$$\mathbf{s}_1 = \begin{pmatrix} 0 \\ a \end{pmatrix} \tag{6.6}$$

If

$$\mathbf{x} = \mathbf{s} + \mathbf{n} \tag{6.7}$$

where $\mathbf{s} \in \{\mathbf{s}_0, \mathbf{s}_1\}$ and $\mathbf{n} \sim \mathcal{N}(0, \sigma^2 \mathbf{I})$, show that

$$\mathbf{x}|0 = \begin{pmatrix} a + n_1 \\ n_2 \end{pmatrix},\tag{6.8}$$

and

$$\mathbf{x}|1 = \begin{pmatrix} n_1 \\ a + n_2 \end{pmatrix},\tag{6.9}$$

6.4 Obtain a scatterplot of s_0 and s_1 .

Solution:

https://raw.githubusercontent.com/gadepall/ EE1390/master/manuals/supervised/ linear_class/codes/bfsk_scatter.py

6.5 Find

$$p_{\mathbf{x}|\mathbf{s}_0}(\mathbf{x}) \tag{6.10}$$

$$p_{\mathbf{x}|\mathbf{s}_1}(\mathbf{x}) \tag{6.11}$$

6.6 How will you decide between s_0 and s_1 if you have x?

7 OPTIMUM CLASSIFIER

7.1 Let (X, G) be an input/output dataset, whose relation f is unknown. Also

$$\mathbf{g} \in \mathbf{G} = \{\mathbf{g}_k\}_{k=1}^K \tag{7.1}$$

Let

$$C\left(\mathbf{g}_{k},\mathbf{g}_{l}\right) = \begin{cases} 1 & k=l\\ 0 & k\neq l \end{cases}$$
 (7.2)

where \mathbf{g}_i are different classes of output data. Thus C is a *correctness* metric.

7.2 Show that

$$\max_{\mathbf{g} \in \mathbf{G}} E\left[C\left(\mathbf{G}, f\left(\mathbf{X}\right)\right)\right] = \max_{\mathbf{g} \in \mathbf{G}} p\left(\mathbf{g} | \mathbf{X} = \mathbf{x}\right)$$
 (7.3)

Solution: In the above,

$$\begin{aligned} \max_{\mathbf{g} \in \mathbf{G}} E\left[C\left(\mathbf{G}, f\left(\mathbf{X}\right)\right)\right] \\ &= \max_{\mathbf{g} \in \mathbf{G}} E_{\mathbf{X}}\left[E_{\mathbf{G}}\left\{C\left(\mathbf{G}, f\left(\mathbf{x}\right)\right)\right\}\right] \end{aligned} \tag{7.4}$$

$$= \max_{\mathbf{g} \in \mathbf{G}} \sum_{k=1}^{K} C\{\mathbf{g}_{k}, \mathbf{g}\} p(\mathbf{g}_{k} | \mathbf{X} = \mathbf{x})$$
 (7.5)

From (7.2), the above expression simplifies to

$$\max_{\mathbf{g} \in \mathbf{G}} E\left[C\left(\mathbf{G}, f\left(\mathbf{X}\right)\right)\right] = \max_{\mathbf{g} \in \mathbf{G}} p\left(\mathbf{g} | \mathbf{X} = \mathbf{x}\right) \ (7.6)$$
